

JAVA - THE ARRAYLIST CLASS

The ArrayList class extends AbstractList and implements the List interface. ArrayList supports dynamic arrays that can grow as needed.

Standard Java arrays are of a fixed length. After arrays are created, they cannot grow or shrink, which means that you must know in advance how many elements an array will hold.

ArrayLists are created with an initial size. When this size is exceeded, the collection is automatically enlarged. When objects are removed, the array may be shrunk.

The ArrayList class supports three constructors. The first constructor builds an empty array list.

```
ArrayList( )
```

The following constructor builds an array list that is initialized with the elements of the collection c.

```
ArrayList(Collection c)
```

The following constructor builds an array list that has the specified initial capacity. The capacity is the size of the underlying array that is used to store the elements.

The capacity grows automatically as elements are added to an array list.

```
ArrayList(int capacity)
```

Apart from the methods inherited from its parent classes, ArrayList defines following methods:

SN	Methods with Description
1	void add(int index, Object element) Inserts the specified element at the specified position index in this list. Throws IndexOutOfBoundsException if the specified index is out of range (index < 0 index > size()).
2	boolean add(Object o) Appends the specified element to the end of this list
3	boolean addAll(Collection c) Appends all of the elements in the specified collection to the end of this list, in the order that they are returned by the specified collection's iterator. Throws NullPointerException if the specified collection is null.
4	boolean addAll(int index, Collection c) Inserts all of the elements in the specified collection into this list, starting at the specified position. Throws NullPointerException if the specified collection is null
5	void clear() Removes all of the elements from this list.
6	Object clone()

Returns a shallow copy of this ArrayList.

7 **boolean contains(Object o)**

Returns true if this list contains the specified element. More formally, returns true if and only if this list contains at least one element e such that (`o==null ? e==null : o.equals(e)`).

8 **void ensureCapacity(int minCapacity)**

Increases the capacity of this ArrayList instance, if necessary, to ensure that it can hold at least the number of elements specified by the minimum capacity argument.

9 **Object get(int index)**

Returns the element at the specified position in this list. Throws `IndexOutOfBoundsException` if the specified index is is out of range (`index < 0 || index >= size()`).

10 **int indexOf(Object o)**

Returns the index in this list of the first occurrence of the specified element, or -1 if the List does not contain this element.

11 **int lastIndexOf(Object o)**

Returns the index in this list of the last occurrence of the specified element, or -1 if the list does not contain this element.

12 **Object remove(int index)**

Removes the element at the specified position in this list. Throws `IndexOutOfBoundsException` if index out of range (`index < 0 || index >= size()`).

13 **protected void removeRange(int fromIndex, int toIndex)**

Removes from this List all of the elements whose index is between `fromIndex`, inclusive and `toIndex`, exclusive.

14 **Object set(int index, Object element)**

Replaces the element at the specified position in this list with the specified element. Throws `IndexOutOfBoundsException` if the specified index is is out of range (`index < 0 || index >= size()`).

15 **int size()**

Returns the number of elements in this list.

16 **Object[] toArray()**

Returns an array containing all of the elements in this list in the correct order. Throws `NullPointerException` if the specified array is null.

17 **Object[] toArray(Object[] a)**

Returns an array containing all of the elements in this list in the correct order; the runtime type of the returned array is that of the specified array.

18 void trimToSize()

Trims the capacity of this ArrayList instance to be the list's current size.

Example:

The following program illustrates several of the methods supported by ArrayList:

```
import java.util.*;  
  
public class ArrayListDemo {  
    public static void main(String args[]) {  
        // create an array list  
        ArrayList al = new ArrayList();  
        System.out.println("Initial size of al: " + al.size());  
  
        // add elements to the array list  
        al.add("C");  
        al.add("A");  
        al.add("E");  
        al.add("B");  
        al.add("D");  
        al.add("F");  
        al.add(1, "A2");  
        System.out.println("Size of al after additions: " + al.size());  
  
        // display the array list  
        System.out.println("Contents of al: " + al);  
        // Remove elements from the array list  
        al.remove("F");  
        al.remove(2);  
        System.out.println("Size of al after deletions: " + al.size());  
        System.out.println("Contents of al: " + al);  
    }  
}
```

This would produce the following result:

```
Initial size of al: 0  
Size of al after additions: 7  
Contents of al: [C, A2, A, E, B, D, F]  
Size of al after deletions: 5  
Contents of al: [C, A2, E, B, D]
```
